ABSTRACT

In today's fast-paced world, booking transportation quickly and efficiently is crucial. Our **Bus Reservation System** allows customers to book a bus by selecting the date, time, and destination. Upon submission, the system displays a list of available buses. Users can choose a bus, enter passenger details, and confirm the booking. The system then provides a confirmation message, ensuring a smooth reservation process. Using **HTML, CSS, JavaScript, and PHP**, this project aims to enhance the efficiency of bus ticket booking, reducing manual effort and saving time for travelers.

INTRODUCTION

Booking a bus ticket can often be a tedious and time-consuming process, requiring users to visit multiple platforms or counters. Our **Bus Reservation System** simplifies this by providing a user-friendly online platform where customers can check available buses, choose a suitable option, and book their tickets with ease. This system not only improves customer convenience but also enhances operational efficiency for bus service providers.

AIM AND OBJECTIVES

- To develop an efficient online **bus reservation system** for users.
 - To allow customers to **search for available buses** based on date, time, and destination.
 - To provide an **easy-to-use booking interface** for selecting a bus and entering passenger details.
 - To ensure **real-time confirmation** of bookings.
 - To integrate a **secure and responsive design** for better accessibility.
-

GENERAL OVERVIEW OF THE PROBLEM

Many individuals face difficulties while booking bus tickets, such as:

- **Limited availability information:** Customers often struggle to find real-time seat availability.
- **Manual booking delays:** Traditional methods involve long queues and wait times.
- **Lack of user-friendly platforms:** Many existing systems are complex and not mobile-friendly.
- **Booking confirmation issues:** Customers may not receive instant confirmation of their reservations.

To solve these issues, a **web-based bus reservation system** is necessary.

FEASIBILITY STUDY

Technical Feasibility:

The project uses **HTML, CSS, JavaScript, and PHP**, which are widely used and well-supported. The backend will handle bookings and database management, ensuring smooth functionality.

Operational Feasibility:

Users will find it easy to **search for buses, choose options, and confirm bookings**. The system ensures a **seamless and intuitive experience** for both customers and bus operators.

Economic Feasibility:

The project requires minimal investment, mainly in **web hosting and domain registration**, making it a cost-effective solution for bus operators.

PROBLEM DEFINITION

Currently, customers face several challenges in booking bus tickets:

- **Lack of a centralized system** to check bus availability.
- **Confusing interfaces** on existing platforms.
- **Delayed or uncertain booking confirmations.**

Our system aims to **simplify the process** by providing a **real-time, user-friendly booking experience.**

PROPOSED SOLUTION STRATEGY

User Module:

1. Customers enter **date, time, and destination**.
2. System **displays available buses**.
3. Users select a bus and **enter passenger details**.
4. On submission, a **confirmation message** is displayed.

Admin Module:

1. Manages **bus schedules and availability**.
 2. Handles **user bookings and queries**.
 3. Generates **booking reports** for analysis.
-

PROJECT PLAN

TEAM STRUCTURE:

- **Shrish Raj (Team Lead)** – Project coordination, frontend development
- **Piyush** – Backend development and database management
- **Aman** – UI/UX design and documentation

HARDWARE AND SOFTWARE REQUIREMENTS:

Hardware Requirements:

- Processor: Intel i3 or above
- RAM: Minimum 4GB
- Storage: 4GB+ for project files
- Network: Stable internet connection

Software Requirements:

- **Operating System:** Windows 8/10
- **Development Tools:** VS Code
- **Frontend Technologies:** HTML, CSS, JavaScript
- **Backend Technology:** PHP
- **Database:** MySQL

CONCLUSION

The **Bus Reservation System** provides an efficient, user-friendly platform for booking bus tickets online. By **automating the process**, users can easily check availability, select buses, enter passenger details, and receive instant confirmation. The use of **HTML, CSS, JavaScript, and PHP** ensures a seamless experience, while real-time booking updates enhance efficiency. This system **reduces manual effort, improves accessibility,** and **saves time** for travelers and bus service providers alike.
